

### Content & Actors & Actors\_Content\_linking

- Users and the service team are only allowed to browse what is already on the website. On the contrary, the content management team can add new content and actors, link actors and content together, and update and delete them.

### Profiles & Account & Payment & Subscription

- The content management team basically has nothing to do with the user side, and all they can do is read these tables. In special tables like payment, they are not even allowed to read for security purposes. The service team takes responsibility for assisting users with their accounts & subscriptions, so they have some control over these tables. They can help users create and delete their profiles, update their information, and adjust subscriptions when needed. The user is the most powerful role among the three. They can do almost anything to their personal information and preferences. However, one thing that blocked users was deleting their accounts. We want to be very careful about this, and this action is only allowed to be done by the service team when users reach out and require to do so.

### Plans

- The plans table is only for the service team to adjust the current plans that Netflix provides.

### Profiles\_Content\_linking

- This table is like the watch list of each user. The user & service teams can create, read, and delete records in it, and the content management team may update the content accordingly.
